

Bona 2-K filler

An effective solution to fill the gap

Bona[®]

Rustic look parquet floors are very popular but getting rid of the holes, knots, cracks and big gaps in a practical, effective and aesthetically pleasing way can be tricky.

Until now, a UV filler material or a water-based filler would normally be used to even out the wood's surface, but both are prone to shrinking. When filling bigger gaps in the wood, the UV filler can sometimes even crack and bubbles appear as a result of the air trapped during application.

After thoroughly researching the needs on the market, we have developed the Bona 2-K Filler for applying a quick drying, hassle-free two-component polyurethane filler to effectively solve this problem. This is the best two-component filler in the market - both in terms of the material and the applicator machine.

Advantages of the new 2-K filler

The two components are fed into the machine and automatically mixed at a 50-50 filler/hardener ratio. They can be mixed and applied 'shot by shot' to give 1.1 cl per shot of material and 30 shots per minute, giving 33 cl mixed material per minute. This means you don't need to mix a whole batch; you just apply what you need straight onto the boards.

The filler also has extremely good adhesion to wood and it doesn't shrink: it actually expands slightly. You simply apply it then let it dry. The surface dries almost immediately (approx. 3 minutes) and is fully sandable after 15 minutes. This is a significant improvement on the 24 hours required to cure a water-based filler. After a mere 15 minutes, you can start to sand, profile or treat the parquet.
