

## Bona colour system

Increase versatility while reducing inventory

The trend in the parquet industry is towards more varied and unique colours. In the past, Bona helped customers by supplying a ready-mixed colour or tint to order. Now, thanks to our new tinting system, we have made it possible for our customers to mix their own colours on site.

This easy, time saving solution that increases flexibility and leads to very precise results. It means our customers can produce the colours they want on demand, leading to a reduction in inventory and minimal product waste.

**Accurate and repeatable results**

The new system - comprising a dispenser and mixer - provides the perfect in-house colour system for floor manufacturers. The equipment just needs to be connected to a standard computer with the capacity to run a specific software. Bona can also supply a database of ready-made colours. The dispenser houses 16 different

pigments. There are a number of standard colours available on the system, which can be adjusted as needed. If you require a new formula for a unique colour, all you need to do is specify the colour required and Bona will mail you the recipe. The recipe will then be stored in the system's database for easy repeatability in future. The mixer can handle up to 40 kg and has adjustable mixing speed and times. It can also be used for UV coatings.
